## Communication section

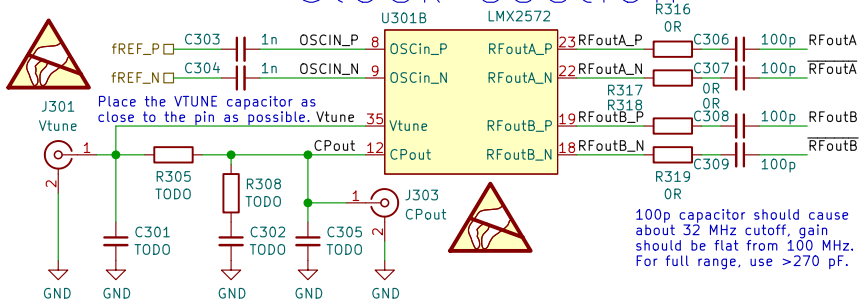

Place these pullups only in case LMX2592 is used.  
Do not place them when LMX2572 is used!

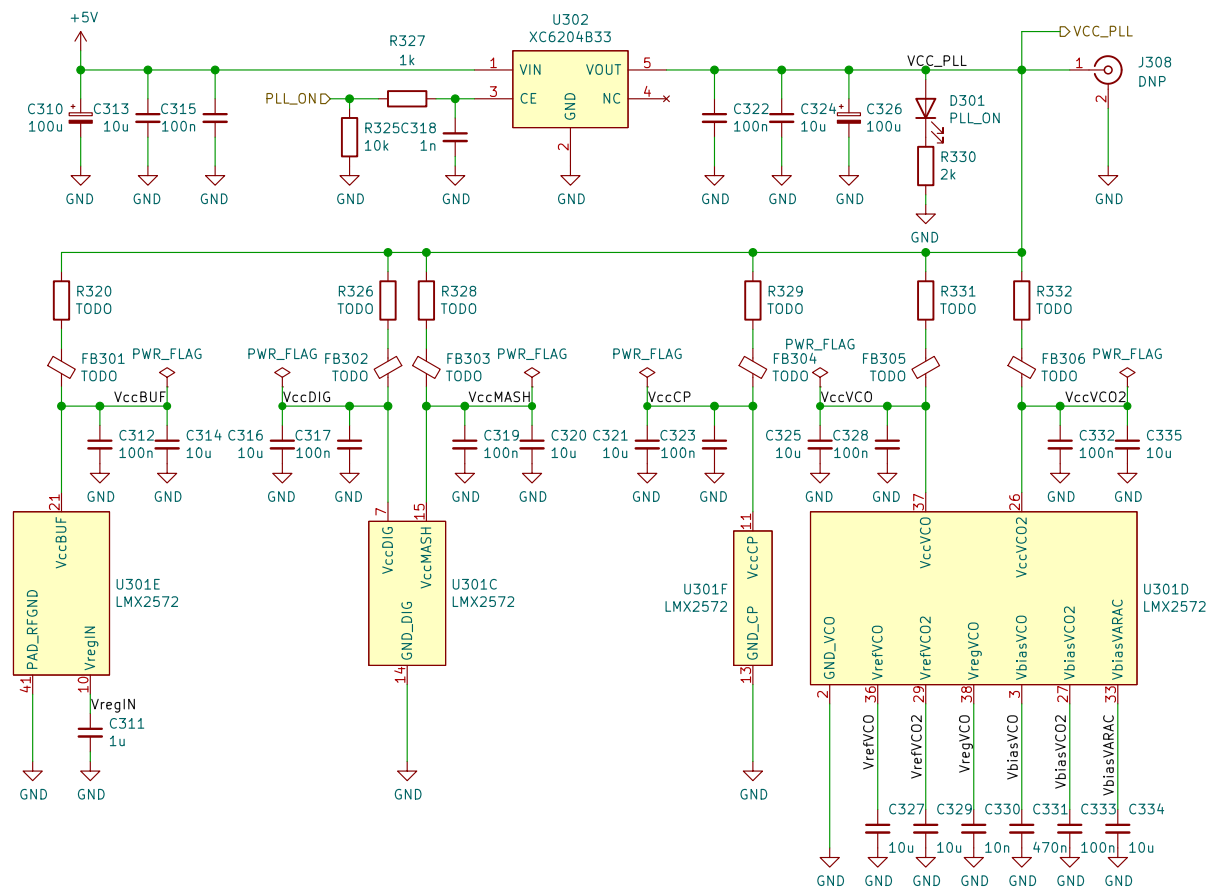

The output impedance of LMX2572 is "... just a few ohms." (citation)  
The impedance should be measured and according series resistors should be placed to get 50R output. Place the resistors as close as possible to the PLL.  
<https://e2e.ti.com/support/clock-and-timing/f/48/t/833789?LMX2572-LMX2592-RF-output-impedance-For LMX2592, place 0R resistors.>

## Clock section

100pF capacitor should cause about 32 MHz cutoff, gain should be flat from 100 MHz. For full range, use >270 pF.

## Power section

Be careful as the outputs have no protections and can be sensitive to ESD or devices with DC offset.  
Before connecting anything, first be sure to discharge any charge present on the core of the connecting cable and on the connected device!

# Duty factor / DC corrector

Idiotic ...G66 symbol. The floating labels are power supply.

DO NOT update the logic gate.  
For unknown reasons, its VCC pin overrides net name.

Duty factor correcting circuitry for external reference input. Assemble only when problems with DF on external ref. appear.

# Reference frequency input

The Si53301 requires slew rate at least 750 V/us to meet 50 fs additive jitter.  
This would require 5.5 V<sub>pk-pk</sub> @ 10 MHz or 1.45 V<sub>pk-pk</sub> at 40 MHz for sine wave.  
Therefore, clipped sine wave or rectangle is required for best jitter performance.  
The clipped sine should have slew rate at least 400 V/us and voltage at least 150 mVpp,  
edges should be shorter than 1 ns.

J202

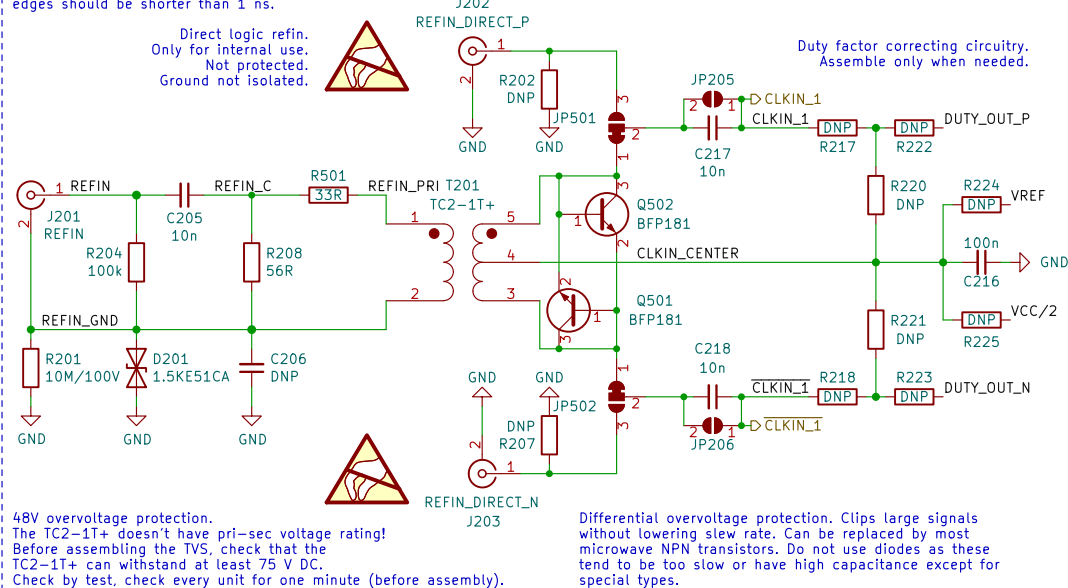

REFIN\_DIRECT\_P

Direct logic refn.  
Only for internal use.  
Not protected.  
Ground not isolated.

Duty factor correcting circuitry.  
Assemble only when needed.

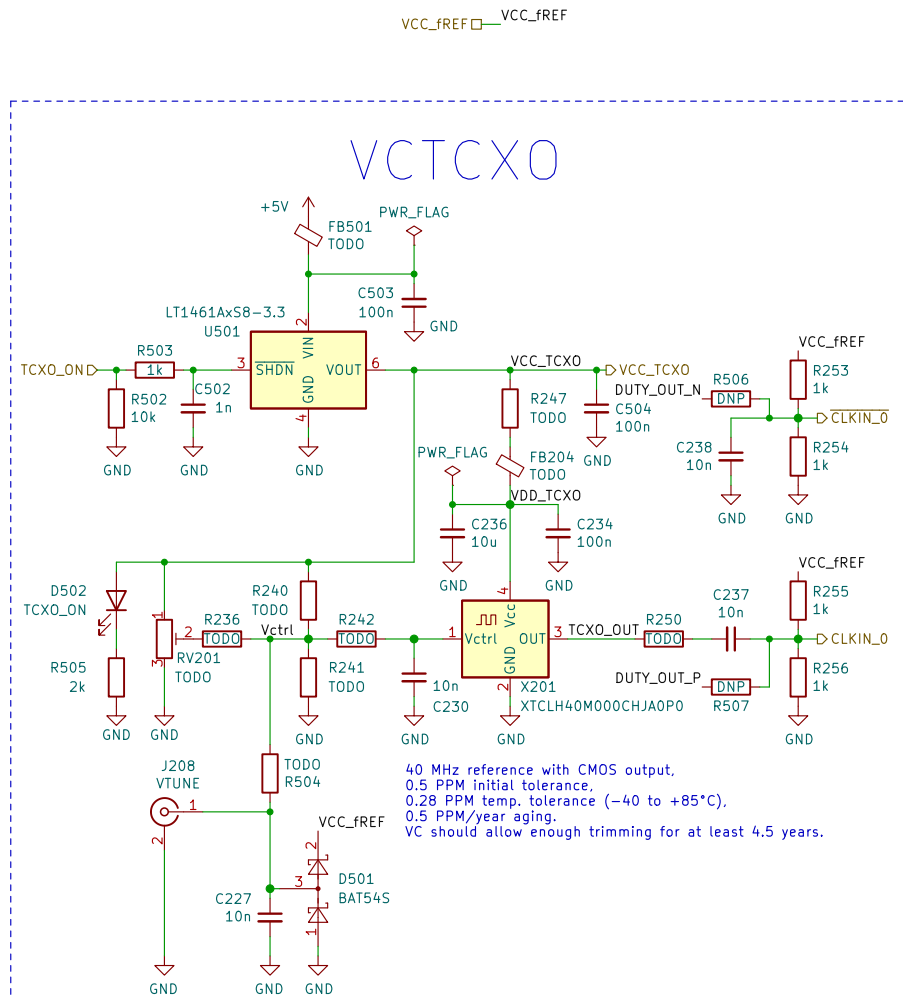

48V overvoltage protection.  
The TC2-1T+ doesn't have pri-sec voltage rating!  
Before assembling the TVS, check that the  
TC2-1T+ can withstand at least 75 V DC.  
Check by test, check every unit for one minute (before assembly).

Differential overvoltage protection. Clips large signals  
without lowering slew rate. Can be replaced by most  
microwave NPN transistors. Do not use diodes as these  
tend to be too slow or have high capacitance except for  
special types.

[illegible]

VCC\_fREF  VCC\_fREF

40 MHz reference with CMOS output,  
0.5 PPM initial tolerance,  
0.28 PPM temp. tolerance ( $-40$  to  $+85^{\circ}\text{C}$ ),  
0.5 PPM/year aging.  
VC should allow enough trimming for at least 4.5 years.
